

Suggest me a school exam and progress report school management project based on recommendations given by you. Provide the directory structure and code as well for the entire project

Certainly! Here's a **School Exam and Progress Report Management System** built using **Next.js for frontend** and **Node.js with Express for backend**, optimized for deployment on **Vercel**.

Project Overview

This system allows:

- **Admins** to manage students, exams, results, and progress reports.
- **Teachers** to input student marks.
- **Students** to view their grades and progress reports.
- **Authentication** via NextAuth.js..
- **Database** with PostgreSQL using Prisma.

Directory Structure

```
school-management-system/
├── frontend/      # Next.js app
|   ├── pages/
|   |   ├── index.js # Dashboard
|   |   ├── login.js # Auth page
|   |   ├── students/ # Student management
|   |   ├── components/ # Reusable UI elements
|   |   ├── styles/    # Styling (CSS/Tailwind)
|   |   ├── utils/    # Helper functions
|   |   ├── services/  # API calls
|   |   └── next.config.js
|   └── package.json
|
|   └── .env
|
└── backend/      # Node.js API
    └── src/
```

```
| |   |-- routes/
| |   |   |-- auth.js    # Login / register
| |   |   |-- students.js # Student operations
| |   |   |-- exams.js   # Exams & results
| |   |   |-- reports.js # Progress reports
| |   |-- controllers/  # Business logic
| |   |-- models/       # Prisma schema
| |   |-- middleware/   # Authentication & validation
| |   |-- server.js     # Express server
| |-- prisma/
| |   |-- schema.prisma # Database schema
| |-- package.json
| |-- .env
| |-- README.md
```

Backend (Node.js + Express)

Server Setup (server.js)

javascript

```
import express from 'express';
import cors from 'cors';
import dotenv from 'dotenv';
import authRoutes from './routes/auth.js';
import studentRoutes from './routes/students.js';
import examRoutes from './routes/exams.js';
import reportRoutes from './routes/reports.js';
```

```
dotenv.config();
```

```
const app = express();
```

```
app.use(cors());
```

```
app.use(express.json());  
  
app.use('/api/auth', authRoutes);  
app.use('/api/students', studentRoutes);  
app.use('/api/exams', examRoutes);  
app.use('/api/reports', reportRoutes);  
  
const PORT = process.env.PORT || 5000;  
app.listen(PORT, () => console.log(`Server running on port ${PORT}`));
```

Database Schema (prisma/schema.prisma)

prisma

```
model Student {  
    id      String @id @default(uuid())  
    name    String  
    email   String @unique  
    exams   Exam[]  
}  
  
model Exam {
```

```
    id      String @id @default(uuid())  
    subject String  
    score   Int  
    student Student @relation(fields: [studentId], references: [id])  
    studentId String  
}
```

Frontend (Next.js)

Login Page (pages/login.js)

javascript

```
import { signIn } from "next-auth/react";
```

```
export default function Login() {  
  return (  
    <div>  
      <h1>Login to School Management System</h1>  
      <button onClick={() => signIn('google')}>Login with Google</button>  
    </div>  
  );  
}
```

Dashboard (pages/index.js)

javascript

```
import { useSession } from "next-auth/react";
```

```
export default function Dashboard() {
```

```
  const { data: session } = useSession();
```

```
  if (!session) return <p>Please login</p>;
```

```
  return <h1>Welcome {session.user.name}</h1>;
```

```
}
```

Deployment

1. Backend on Vercel:

- Use Vercel serverless functions (backend/src/api/).
 - Alternatively, deploy on **Railway** for persistent connections.

2. Frontend on Vercel:

- npm run build
- vercel deploy

Starting a fresh project once again

Let's build your **School Exam and Progress Report Management System** step by step from scratch. We'll go through **backend setup**, **frontend implementation**, and **deployment** to Vercel.

◆ Step 1: Initialize Your Project

1. Setup the Backend

Navigate to your workspace and create the backend project:

Bash

 Copy

```
mkdir school-management-system && cd school-management-system  
mkdir backend && cd backend  
npm init -y
```

Install essential dependencies:

Bash

```
npm install express cors dotenv prisma @prisma/client
```

Install nodemon for development:

Bash

```
npm install --save-dev nodemon
```

◆ Step 2: Configure Prisma for PostgreSQL

1 Initialize Prisma

Bash

 Copy

```
npx prisma init
```

This creates a `prisma/schema.prisma` file and an `.env` file.

2. Define Your Database Schema (`prisma/schema.prisma`)

Replace its contents with:

Prisma

 Copy

```
generator client {
  provider = "prisma-client-js"
}

datasource db {
  provider = "postgresql"
  url      = env("DATABASE_URL")
}

model Student {
  id      String @id @default(uuid())
  name    String
  email   String @unique
  exams   Exam[]
}

model Exam {
  id      String @id @default(uuid())
  subject String
  score   Int
  student Student @relation(fields: [studentId], references: [id])
  studentId String
}
```

3. Migrate the Database

Bash

 Copy

```
npx prisma migrate dev --name init
```

◆ Step 3: Backend Server Setup

1. Create server.js

Inside backend/, create server.js and add:

Javascript

 Copy

```
import express from 'express';
import cors from 'cors';
import dotenv from 'dotenv';
import authRoutes from './routes/auth.js';
import studentRoutes from './routes/students.js';
import examRoutes from './routes/exams.js';
import reportRoutes from './routes/reports.js';

dotenv.config();
const app = express();

app.use(cors());
app.use(express.json());

app.use('/api/auth', authRoutes);
app.use('/api/students', studentRoutes);
app.use('/api/exams', examRoutes);
app.use('/api/reports', reportRoutes);

const PORT = process.env.PORT || 5000;
app.listen(PORT, () => console.log(`Server running on port ${PORT}`));
```

◆ Step 4: Set Up Frontend (Next.js)

1. Initialize Next.js

Navigate back to the root project directory:

Bash

 Copy

```
cd ..
mkdir frontend && cd frontend
npx create-next-app@latest .
```

2 Install Dependencies

Bash

 Copy

```
npm install next-auth react-query tailwindcss
```

3 Configure `next.config.js`

Javascript

 Copy

```
module.exports = {
  reactStrictMode: true,
};
```

4 Create Authentication in `pages/login.js`

Javascript

 Copy

```
import { signIn } from "next-auth/react";

export default function Login() {
  return (
    <div>
      <h1>Login to School Management System</h1>
      <button onClick={() => signIn('google')}>Login with Google</button>
    </div>
  );
}
```

◆ Step 5: Deployment

1. Backend Deployment (Vercel)

- Commit your backend code to GitHub.
- Install Vercel CLI:

Bash

 Copy

```
npm install -g vercel
```

- Deploy using:

Bash

 Copy

```
vercel deploy
```

2 Frontend Deployment

- Commit frontend to GitHub.
- Deploy frontend:

Bash

 Copy

```
npm run build
vercel deploy
```

This gives you a **fresh start** for your project! 🎉 Let me know if you run into any hurdles along the way.

Result at Terminal console while following the steps mentioned

15 packages are looking for funding

```
(base) PS C:\Users\jagdevsinghdosanjh.RHINO\school-mamagement-system\backend> npx  
prisma init
```

>>

Fetching latest updates for this subcommand...

✓ Your Prisma schema was created at prisma/schema.prisma

You can now open it in your favorite editor.

Next steps:

1. Set the DATABASE_URL in the .env file to point to your existing database. If your database has no tables yet, read <https://pris.ly/d/getting-started>
2. Set the provider of the datasource block in schema.prisma to match your database: postgresql, mysql, sqlite, sqlserver, mongodb or cockroachdb.
3. Run prisma db pull to turn your database schema into a Prisma schema.
4. Run prisma generate to generate the Prisma Client. You can then start querying your database.
5. Tip: Explore how you can extend the ORM with scalable connection pooling, global caching, and real-time database events. Read: <https://pris.ly/cli/beyond-orm>

More information in our documentation:

<https://pris.ly/d/getting-started>
